Half-life

Not all of the atoms in a sample of radioactive material break down or decay at the same time.

- This is a gradual process, but a rate can be determined.
- The process itself is measured in terms of the half-life, or the amount of time it takes for $1 / 2$ of the total number of atoms present in a sample to decay.

## Radioactive dating

- Assume a radioactive isotope with a halflife of 1 million years.
- What percentage of 'parent material' is left after:
- 1 million years?
-3 million?
-5 million?
-0 ?

## Radioactivity Problems

## Problem Type \#1: Fraction of parent material remaining

Given the half-life of $\mathbf{U}$ - 235 is $\mathbf{0 . 7}$ billion years, determine the age of a sample of $\mathbf{U}-\mathbf{2 3 5}$ if $\mathbf{1 / 1 6}$ of the starting material remains.

Given: $\quad$ Half-life $=0.7$ billion years
Fraction of parent ( $\mathbf{U}-\mathbf{2 3 5}$ ) remaining $=\mathbf{1 / 1 6}$
$>\quad$ You must first find out how many half-lives have passed if $1 / 16$ of the parent (U-235) remains.

| Number <br> of half <br> lives | Fraction <br> remaining |
| :---: | :---: |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |

## Radioactivity Problems

## Problem Type \#1: Fraction of parent material remaining

Given the half-life of $\mathbf{U}$ - 235 is $\mathbf{0 . 7}$ billion years, determine the age of a sample of $\mathbf{U}-\mathbf{2 3 5}$ if $\mathbf{1 / 1 6}$ of the starting material remains.

$$
\begin{array}{ll}
\text { Given: } & \text { Half-life }=0.7 \text { billion years } \\
& \text { Fraction of parent }(\text { U-235 }) \text { remaining }=1 / 16 \\
\hline
\end{array}
$$

$>\quad$ You must first find out how many half-lives have passed if $1 / 16$ of the parent (U-235) remains.

| Number <br> of half <br> lives | Fraction <br> remaining |
| :---: | :---: |
| 0 | $1 / 1$ |
| 1 | $1 / 2$ |
| 2 | $1 / 4$ |
| 3 | $1 / 8$ |
| 4 | $1 / 16$ |

$$
\begin{aligned}
& \text { Age }=\# \text { of Half-lives } x \text { Time for } 1 \text { Half-life } \\
& \text { Age }=(4)(0.7 \text { Billion years }) \\
& \text { Age }=2.8 \text { Billion years }
\end{aligned}
$$

## Radioactivity Problems

## Problem Type \#2: Mass of parent material remaining

1200 g of a radioactive element has decayed to produce 150 g of the element. If the half-life of the mineral is 0.40 billion years, what is the age of the sample?

## Given:

1200 grams decays to 150 grams \& Half-life $=\mathbf{0} .4$ Billion years
You must first find out how many half-lives have passed when 1200 grams decays to form $\mathbf{1 5 0}$ grams

## Radioactivity Problems

## Problem Type \#2: Mass of parent material remaining

1200 g of a radioactive element has decayed to produce 150 g of the element. If the half-life of the mineral is 0.40 billion years, what is the age of the sample?

## Given:

1200 grams decays to 150 grams \& Half-life $=\mathbf{0} .4$ Billion years

Age $=$ \# of Half-lives $x$ Time for 1 Half-life

Age $=(3)(0.4$ Billion years $)$
Age $=$ 1.2 Billion years

## Radioactivity Problems

## Problem Type \#3: Decay Graph

Element X has a half-life of $\mathbf{2 5 0 , 0 0 0}$ years. Suppose that $\mathbf{2 5 6}$ g of element $X$ were initially present in a sample of rock.
(i) Construct a half-life decay graph to illustrate the decay process for 5 half-life periods.
(ii) How many grams of element X will remain after one million years have expired?

## Information Given:

Half-life $=\mathbf{2 5 0 , 0 0 0}$ years
Mass of "X" = $\mathbf{2 5 6}$ grams (Initial amount of radioactive element)

## Radioactivity Problems

## Problem Type \#3: Decay Graph

(i) Construct a half-life decay graph to illustrate the decay process for 5 half-life periods.

| Number <br> of half <br> lives | grams <br> remaining | percent <br> remaining |
| :--- | :--- | :--- |
| 0 |  |  |
| 1 |  |  |
| 2 |  |  |
| 3 |  |  |
| 4 |  |  |
| 5 |  |  |
